                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to assays involving two human homologues of Gaenorhabditis elegans ced-6 (h1ced-6 and h2ced-6) for identifying compounds which function as an inhibitor or an enhancer of a signal transduction pathway. The assays are carried out by measuring phagocytosis of apoptotic cells. The methods are useful for identifying compounds which can act as apoptotic modulators which are useful for treating diseases such as cancer, autoimmune diseases, neurodegenerative diseases such as cancer, autoimmune diseases, neurodegenerative AIDS. The assays are well adapted for medium and high throughput screening using a multi-well plate format. The present sequence represents the DNA sequence of plasmid pGL2 which is suitable for inroduction of reporter gene luciferase into Ba/K3 cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Assays for determining the phagocytosis of apoptotic cells useful identifying a compound which influences the phagocytic uptake of apoptotic cells and treats cancers and neurodegenerative diseases.

                                                                                                                                   Ś
                                                                                                                                                         The patent discloses methods for determining the p53 status of a sample CCC which comprise providing a sample containing a pGLJ3 luciferase reporter vector and determining whether p53 binds to the pGLJ3 vector. p53 is a CC transcription factor that regulates many genes including those associated CC with cell cycle control, apoptosis and DNA damage repair. pGLJ3 reporter CC vectors contain a modified firefly luciferase CDNA designated luc+. p53 ccc protein binds to pGLJ3-basic vector and causes luciferase expression. The CC method is useful for determining the p53 status of a sample. It is also CC useful for assaying for mimetics or antagonists of p53 and for assaying CC for presence of activated p53 and/or DNA damage. The invention also CC relates to a method of modifying pGLJ3 vector which involves deletion or CC alteration of a CCCGGG montif of the pGLJ3 vector and/or deleting or CC altering a sequence within 20 bp sequence 5' or 3' of CCCGGG motif. The CC conferring promoter activity or p53-responsiveness on a nucleic acid cencoding a polypeptide of interest or in assays for p53 transcriptional CC activity. The present DNA sequence is pGLJ3 control vector sequence

                                                                         The present invention describes an expression vector comprising a short hairpin RNA (shRNA) construct under the control of a ubiquitous promoter. Also described: (1) a method for constitutive and/or inducible gene knock down in a vertebrate, or in a tissue culture or cells of a cell culture derived from a vertebrate by stably integrating an expression vector into the cell culture; and (2) a vertebrate or tissue culture or of the cells of the cell culture, and (2) a vertebrate, tissue culture or cell culture derived dependent locus or the vertebrate, tissue culture or cells of the tissue culture, an expression vector as defined above. The expression vector can be used in gene therapy. The expression vector is useful for preparing an agent, shRNA, for constitutive and/or inducible gene knock down in a vertebrate, or in a tissue culture or cells of a cell culture derived from a vertebrate. The present sequence represents a nucleotide sequence which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New expression vector comprising a short hairpin RNA (shRNA) construct under the control of a ubiquitous promoter, useful for constitutive and/or inducible gene knock down in a vertebrate, or in a tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              17-OCT-2002; 2002EP-00023283.

                                                                                          Matches
                                                                                                                                                                                   reporter gene (comprising coding sequences from two different genes fused to produce a gene product that is detectable without the need to lyse or otherwise destroy or diminish the viability of the cell in which they are expressed) operably linked to at least one transcription control element. The reporter construct is useful for detecting substances that interact with cell surface receptors, such as those of the G-protein coupled receptor family, tyrosine kinase-type receptors or ion channels. The construct is particularly useful in high-throughput screening assays. The construct is used in recombinant G-protein coupled receptor assays which are more sensitive and less labour and time-intensive than previous assays. The present sequence is pcfUSII plasmid comprising TPA (12-0-tetradecancylphorbol-13-acetate) responsive elements (TREs), minimal cyromegalovirus promoter, Aequorea victoria enhanced green fluorescent protein (EGFP) gene, firefly luciferase gene, simian virus 40 (SV40)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Reporter construct; transcription control element; cell surface receptor; Gpcrotein coupled receptor; GPCR; tyrosine kinase-type receptor; ion channel; high-throughput screening; HTS; jelly fish; EGFP; enhanced green fluorescent protein; TRR; TPA responsive element; 12-0-tetradecanoylphorbol-13-acetate; CMV; promoter; firefly; luciferase; simian virus 40; SV40; pcfUSII plasmid; chimeric; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Reporter construct with a chimeric reporter gene linked to transcription control element(s), useful for detecting substances that interact with cell surface receptors, e.g. G-protein coupled receptor family or ion
                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a reporter construct, comprising

                                                                                                                                                                                                                       The invention relates to a reporter construct, comprising a chimeric creporter gene (comprising coding sequences from two different genes fused to produce a gene product that is detectable without the need to lyse or otherwise destroy or diminish the viability of the cell in which they are expressed) operably linked to at least one transcription control element. The reporter construct is useful for detecting substances that interact with cell surface receptors, such as those of the G-protein coupled receptor family, tyrosine kinase-type receptors or ion channels. The construct is useful in high-throughput screening assays. The construct is used in recombinant G-protein coupled receptor assays which are more sensitive and less labour and time-intensive than previous assays. The present sequence is perfusing the lamid comprising TPA (12-0-tetradecanoylphorbol-1]-acetate) responsive elements (TRBs), minimal Cytomegglovirus promoter, Aequorea victoria enhanced green fluorescent protein registance, firefly luciferase gene, baculovirus promoter and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Reporter construct with a chimeric reporter gene linked to transcription control element(s), useful for detecting substances that interact with cell surface receptors, e.g. G-protein coupled receptor family or ion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Owman
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Reporter construct; transcription control element; cell surface receptor; G-protein coupled receptor; GPCR; tyrosine kinase-type receptor; for channel; high-throughput screening; HTS; jelly fish; BGFP; enhanced green fluorescent protein; TRE; TPA responsive element; 12-O-tetradecanoylphorbol-13-acetate; CMV; promoter; firefly; luciferase;

                                                           The present invention describes a transgenic non-human mammal whose CC genome comprises a nucleic acid construct comprising a reporter uncleic acid encoding a reporter operably linked to a promoter comprising an CC androgen response element (ARE), and where the construct further CC comprises an androgen receptor nucleic acid acid is regulated by CC expression of the androgen receptor nucleic acid. The mammal expresses the receptor nucleic acid in organs when the androgen receptor nucleic acid is expressed. Also described: (1) a cell isolated from the CC transgenic mouse, where the genome of the cell comprises the nucleic acid construct; (2) a mouse cell line comprising the cell of (1); (3) an CC isolated nucleic acid construct that comprises a reporter nucleic acid construct, where the mouse genome comprises the nucleic acid construct, where the mouse can be bred to produce progeny mice whose genomes comprise the nucleic acid construct, where the mouse can be bred to produce progeny mice whose can be used as an in vivo model for the identification and development of selective androgen receptor modulators for the transgenic non-human mammal content is and an antiquent of cancer or construct and and services and construct as antagonists or caponists in different tissues containing the androgen receptor. The cransgenists or agonists in different tissues containing the androgen receptor. The construct as antagonists or caponists in different tissues containing the androgen receptor. The construct as antagonists or agonists in different tissues containing the androgen receptor. The construct designated ARE-LUC/CMV crar, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New transgenic non-human mammal expressing a reporter nucleic acid under
the regulation of androgen response elements, useful as models for
identifying and developing selective androgen receptor modulators for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    androgen receptor; transgenic mouse;

The patent discloses methods for determining the p53 status of a sample containing a p6L3 luciferase reporter which comprise providing a sample containing a p6L3 luciferase reporter covector and determining whether p53 binds to the p6L3 vector. p53 is a cc transcription factor that regulates many genes including those associated with cell cycle control, apoptosis and DNA damage repair. p6L3 reporter vectors contain a modified firefly luciferase cDNA designated luc+. p53 cc method is useful for determining the p53 status of a sample. It is also considered in the p53 status of a sample. It is also considered for presence of activated p53 and/or DNA damage. The invention also crelates to a method of modifying p6L3 vector which involves deletion or altering a sequence within 20 bp sequence 5, or 3, of CCCGGG motif. The nucleic acid having a sequence incorporating the CCGGGG motif is useful for conferring promoter activity on p53-responsiveness on a nucleic acid cencoding a polypoptide of interest or in assays for p53 transcriptional confideration.
                                                                                                                                                                                                                                                                                                                                        Determining the p53 status of a sample, useful for assaying for mimetics or antagonists of p53, or for the presence of DNA damage, comprises determining whether p53 binds to the pGL3 vector in a sample containing
                                                                                                                                                                                                                                                                                                 Claim
                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2002-130743/17.

Promoter are preferably chosen from the thymidine kinase and gonadotropin-alpha gene preferably chosen from the thymidine kinase and gonadotropin-alpha gene monitoring the activation of a transcription factor. They are also used to determine whether a gene is involved in signal transduction pathway, where the cis-element is a component of a DNA sequence which affects the expression of a test gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 4987 BP; 1295 A; 1188 C; 1207

                                                                                                                                                                                                                                                     CC The present sequence is that of pNFkB-Luc, a plasmid designed for CC monitoring the activation of the NFkB signal transduction pathway. The plasmid contains the firefly luciferase (luc) gene (E354K mutant), and 4 CC tandem copies of the NFkB consensus sequence fused to a TAT-like promoter CC from the herpes simplex virus thymidine kinase gene. A 1912 by segment of CC the plasmid containing the NFkB consensus sequences, the promoter and the CC clored into the XhoI and BamHI sites of the SIN retroviral reporter CC vector, producing SKBL-N. The vector was used for stable reporter cell CC generation in an example of the invention. The invention provides cell-CC modulators of gene expression or cellular activity. The effect of a small CC molecule or other signal on a reporter cell is titrated by expressing CC within the cell cDNA that encodes a polypeptide that is the molecular crayet or that is responsible for directly or indirectly producing the CC molecular target. The method permits identification of gene function by CC can be used. The method is fully automated and provides an increased CC throughput over conventional methods. Miniaturization and automation of construction of function of function of function of function of function of function of construction of function of functions of functions of function of functions of functions of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes producing a collection of responder cells for high throughput screening assays, by identifying and cloning regulatory regions into expression constructs to control nucleic catds, and introducing the constructs into addressable cells. The method is useful in producing cells used in high throughput screening assays for profiling substances and conditions and for studying the function of the regulatory region mediating the response. The cells serve as biosensors to assess the effects of any perturbation, such as external or internal condition, on the cells from which the regulatory regions in the reporter gene constructs are derived can be inferred. This sequence represents a vector useful for the delivery of reporter gene constructs into cells
                                                                                                                                                                                                                                                                                                                                          1402
